Enhanced Modules

Disruption Management

Vehicle and Operator Assignment Modification

CleverCAD Mobile

When unplanned service changes occur, like road work or detours, Clever Devices has you covered with Disruption Management to get you back on track. But what if you need an additional vehicle to help complete service with more passengers than you anticipated? **Vehicle and Operator Assignment Modification (VOAM)**, an enhanced module of **CleverCAD**, is a comprehensive solution for managing vehicle and operator assignments in situations where additional/replacements are needed to support impromptu schedule changes. VOAM also offers a user-friendly web-based interface with intuitive views and a drag-and-drop functionality, enabling dispatchers to quickly and efficiently assign available vehicles and operators to meet operational requirements.

Integration with Disruption Management Module

VOAM seamlessly integrates with CleverCAD's Disruption Management module. When an additional vehicle or vehicle replacement is required due to schedule changes or unforeseen circumstances, VOAM provides the dispatcher with available vehicles and operators to quickly get your service back on track and your passengers to their destinations.

Real-Time Updates and Notifications

VOAM provides real-time updates on assignments, ensuring dispatchers have the most up-to-date information. Changes made in the module are reflected immediately, allowing for effective coordination and communication among dispatchers and operators.

Reporting and Analytics

Integration of the VOAM module directly into CleverCAD guarantees any modifications to the service are reflected in your overall

reporting. This enables your agency to have the most accurate information to make data-driven decisions.

Resource Allocation

By leveraging VOAM's reporting and analytics capabilities, your organization can gain a precise view of what occurred during service that day and properly allocate resources to improve overall efficiency.

Intuitive User Interface

Within the easy-to-use, web-based interface, VOAM dispatchers can simply drag and drop a vehicle or operator from their respective tables to the intended work, selecting the entirety of the work or just the portion that is needed. Dispatchers can also use the same steps to remove a vehicle or operator from scheduled work. The clear, intuitive functionality is designed to minimize the learning curve and enhance operational productivity.
